Subject: Blacktail Creek - spill volume estimate vs recovered water estimate

In the reports for Blacktail Creek, the RP has reported an estimated 70,000 barrels (approx. 3,000,000 gallons) of produced water/brine discharged. Under the direction of the state, the RP has reportedly pumped 100,000 barrels (approx. 4,200,000 gallons) of water/brine/oil from the creek. This recovery volume includes a significant amount of fresh water runoff from rain and snow melt of undetermined volumes.
